

Project Overview

- <u>Dataset: we have used International Football Results from 1872 to 2023</u> dataset from popular website Kaggle:
 - (https://www.kaggle.com/datasets/martj42/international-football-results-from-1872-to-2017?datasetId=4305)
- **Spark:** It is used for getting the dataset and performing some filter and aggregation
- **Hive/HBase:** The enriched result is saved in Hive/HBase.
- **Kafka:** Distributed messaging system which is used for streaming analytics and data integration(Demo Project)

Project Overview

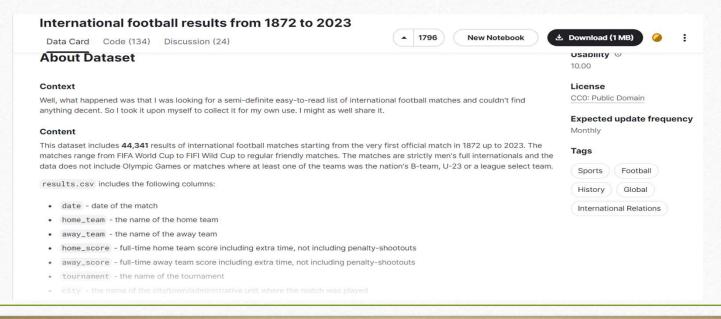

Technology stack used

- ❖ Spark streaming 2.4.4
- ❖ Spark core − 2.4.4
- **❖** Java 8
- **♦** Hadoop − 2.6.0
- ♦ Hbase 2.2.5
- **❖** Hive − 2.3
- **♦** Kafka 2.13-3.5.1

Dataset used

- Used static football dataset from kaggle
- https://www.kaggle.com/datasets/martj42/international-football-results-from-1872-to-2017?datasetId=4305
- Created a program to split the whole dataset into smaller datset to use apache data streaming

Apache Data Streaming sample

*Received csv file as text stream input and allocate infrastructure to complete the allocated

Fig 2: Apache data stream console

Spark Streaming

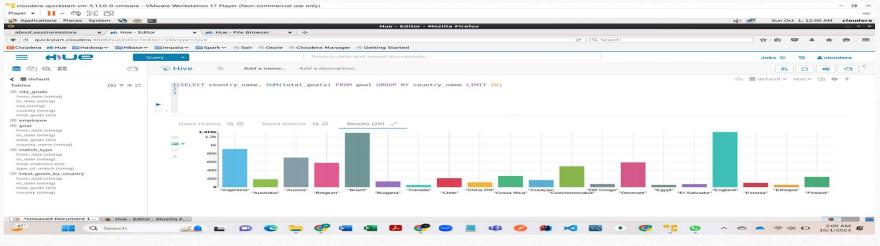

- ❖ Get international football statistics from the split dataset
- Filter required columns like home_team, away_team, home_goal, away_goal, city, match_type etc
- * Calculate total scores by each country, frequency of match type, organizing city with frequency
- Filter data based on threshold values for different use cases

Apache HBASE/Hive

* The output data from spark (aggregated) is persist in HBase/Hive database

Project execution steps

Step 1(Data preparation):

- Created a account in kaggle (https://www.kaggle.com/
- Downloaded static dataset related to international football
- split the dataset into smaller files so that we can apply data streaming and processing operations

Step 2(Data feed to Apache Spark Data Streaming):

 The pipeline is written in shell script which fetch data from local directory in Cloudera VM to the Apache Data Streaming in certain interval of time.

-01-->

Step 3(Real-time Analysis with Apache Spark Streaming):

- Ingest data in every 20 seconds
- Text file streaming is used to load data.
- Different stream function like filter, maptoPair, Union, reducebykey etc are used.
- complex data structure with multiple Tuple are used to get the aggregate data from input data.

Project execution steps

Step 4(Data Processing with Apache Hive):

- Schema Definition: Defined a Hive schema that matches the structure of the output result from Apache data streaming
- Data Loading: Load the CSV data into a Hive table using Hive's LOAD DATA command or other methods for bulk data loading.
- Data Transformation: Use Hive's SQL-like language, HiveQL, to perform various data transformations and aggregations. we calculated statistics, filter data by date, tournament, or teams, and perform other necessary preprocessing.
- Querying: We ran Hive queries to extract insights from the data. For example, we found the countries with the most international goals, city and country organizing most games, the pattern of football match in international tournament, and more.

Project execution steps

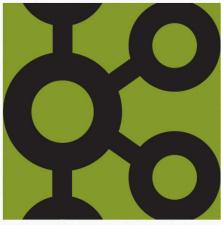

Step 5(Data Export to HBase):

For the demonstration, the aggregate soccer result is exported in HBase table SoccorScoreTable. Every aggregated result from RDD partitions are saved to HBase column-family for use case1 soccer result.

Apache Kafka

 Consist brokers (Kafka cluster) and manage by zookeeper

```

Kafka Demo steps (Demo project related)

- CMD to start zookeeper
- $. \verb|\bin| windows \verb|\zookeeper-server-start.bat|$
- .\config\zookeeper.properties.
- * CMD to start Kafka
- .\bin\windows\kafka-server-start.bat .\config\server.properties
- . CMD to create a topic
- ./bin/kafka-console-consumer.sh --bootstrap-server localhost:9092 --topic gameStriming_Topic [--from-beginning]
- . CMD to create a producer
- ./bin/kafka-console-producer.sh --broker-list localhost:9092 -- topic quickstart-events

Future tasks

Output and Visualization:

- We planned to do visualization of some statistics.
- In future, We plan to visualize the realtime data and insights using data visualization tools like Apache Zeppelin, Jupyter Notebook, or Tableau(connect with Cloudera Hadoop using ODBC client and fetching data from the Hive Tables).
- This can help us provide live updates to football enthusiasts.

Thank you.
